

Stable Nitrogen Isotope Analysis. Samples of phytoplankton (seston), zooplankton, crabs, fishes and seabirds were first homogenized by an analytical mill. The samples were then freeze-dried, and lipids were removed from all samples by methanol extraction for about 12 h to reduce variability due to isotopically lighter lipids. Before isotope analysis, the samples were dried at 80°C for about 4 h. Subsequently, about 0.5 mg samples were set in Sn capsules and combusted at 1000 to 1050°C. Nitrogen gas was then carried through the interface (ConFlo III, Finnigan MAT) and analyzed using a mass spectrometer (Thermo Delta plus, Finnigan MAT). Stable isotope values were expressed as:

$$\delta^{15}\text{N} = \left(\left(^{15}\text{N} / ^{14}\text{N}_{\text{sample}} \right) / \left(^{15}\text{N} / ^{14}\text{N}_{\text{standard}} \right) - 1 \right) \times 1000 (\text{\%}). \quad (1)$$

The $^{15}\text{N} / ^{14}\text{N}_{\text{standard}}$ values were based on atmospheric N_2 (air).

Trophic Level Calculation. Trophic levels of individual aquatic organisms can be calculated using the relationship given by Fisk et al. (1) and Muir et al. (2):

$$\text{TL}_{\text{consumer}} = 2 + \left(\delta^{15}\text{N}_{\text{consumer}} - \delta^{15}\text{N}_{\text{zooplankton}} \right) / 3.8, \quad (2)$$

where $\delta^{15}\text{N}_{\text{consumer}}$ and $\delta^{15}\text{N}_{\text{zooplankton}}$ are stable nitrogen isotope value of consumer and zooplankton; $\text{TL}_{\text{consumer}}$ is the trophic level of consumers, and the TL of zooplankton was assumed to be 2. But for the calculation of trophic level in birds, the diet-tissue isotope fractionation factor is +2.4‰ and the equation should be modified to (1):

$$\text{TL}_{\text{bird}} = 3 + \left(\delta^{15}\text{N}_{\text{bird}} - 2.4 - \delta^{15}\text{N}_{\text{zooplankton}} \right) / 3.8, \quad (3)$$

where TL_{bird} is the trophic level of bird, and $\delta^{15}\text{N}_{\text{bird}}$ is the stable Nitrogen isotope value of birds.

a: pooled sample collected from six locations

Species: PK = phytoplankton/eston; ZK = zooplankton; AI = bay scallop (*Argopecten irradians*); RP = short-necked clam (*Ruditapes philippinarum*); RV = veined rapa whelk (*Rapana venosa*); US = burrowing shrimp (*Upogebia* sp.); PT = crab (*Portunus trituberculatus*); LS = mullet (*Liza soi-uyi*); OR = wolffish (*Obontamblyopus rubicundus*); PI = bartail flathead (*Platycephalus indicus*); CS = catfish (*Chaeturichthys stigmatias*); LJ = weever (*Lateolabrax japonicus*); LA = herring gull (*Larus argentatus*). TL = trophic level; ND = not detected; data were

expressed as “mean \pm standard deviation (SD)” of three replicates. Lipid content was calculated on wet weight basis.
